Project Name	Personalized Networking Assistant
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the implementation of the Personalized Networking Assistant. The solution uses a TypeScript/JavaScript web stack with React and Vite on the frontend, Node.js/Express server-side logic, Google Gemini for personalized networking content generation, Wikipedia for factual context, and SQLite for persistent application data.

Instructions:

1. The code is organized into frontend, server, API, asset, configuration, and reusable application modules.
2. The solution supports professional networking preparation through profile context, event/topic inputs, factual retrieval, and AI-generated networking content.
3. Project source code and configuration required for the implemented application are maintained in the GitHub repository.
4. The repository is used for version control and deployment-oriented project maintenance.

Solution Summary

Field	Details
Repository Link / URL	github.com/thishitha06-sketch/Personalized-Networking-Assistant
Programming Language(s)	TypeScript, JavaScript, HTML, CSS
Framework(s) Used	React, Vite, Node.js, Express
AI / Generation	Google Gemini
Database	SQLite
External APIs / Context	Wikipedia
Development / Deployment	GitHub, Render, Vercel configuration

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into reusable components and functions	Yes
2	Meaningful variable and function names are used	Yes
3	Comments / documentation are included where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application is implemented as an integrated web solution	Yes
6	Code is committed to the project GitHub repository	Yes

Additional Notes / Comments:

- Developed as an AI-powered web application for personalized professional networking preparation.
- Uses user profile and event context to generate relevant networking content through Google Gemini.
- Uses Wikipedia-derived factual context where appropriate to support relevant and grounded discussion topics.
- Stores application data such as profiles, sessions, history, ratings, and feedback using SQLite persistence.
- Includes dashboard-oriented workflows for generation history, feedback, and usage-related information.
- The project repository includes deployment support for the implemented web application.
