

Problem - Solution Fit

Date	05 July 2026
Team ID	
Project Name	Personalized Networking Assistant
Maximum Marks	2 Marks

Problem - Solution Fit Canvas:

Professional networking events often make it difficult for participants to start meaningful conversations, identify relevant discussion topics, and verify information during interactions.

The **Personalized Networking Assistant** uses Artificial Intelligence, Natural Language Processing, DistilBERT, GPT-2, and Wikipedia API to generate personalized conversation starters, analyze event themes, and provide fact-verified information. The solution helps users network confidently, build professional relationships, and improve their overall networking experience.

Problem - Solution Fit Canvas:

Professional networking can be difficult when users do not know how to begin relevant conversations, choose useful discussion topics, or verify event-specific information. The Personalized Networking Assistant addresses this problem through an AI-powered web application that combines personalized professional profiles, event context, Wikipedia factual verification, and Google Gemini generation. It produces structured networking content such as warm openers, elevator pitches, discussion ideas, and LinkedIn follow-ups, while supporting conversation history, ratings, feedback, and dashboard insights.

Purpose:

- Provide personalized, context-aware support for professional networking conversations.
- Use user profile, interests, career goals, event details, and topics as generation context.
- Retrieve event-specific factual context through the Wikipedia API before AI generation.
- Use Google Gemini to generate structured networking suggestions and follow-up content.
- Support secure user accounts, professional profile customization, and subscription options.
- Store generation history and allow users to rate, like, dislike, and submit feedback.
- Present usage and satisfaction insights through an analytical dashboard.
- Provide a responsive web experience with a Node.js/Express backend and SQLite storage.

Problem - Solution Fit Canvas

1. CUSTOMER SEGMENTS • Students and placement seekers • Professionals attending conferences • Job seekers and career builders • Entrepreneurs and startup founders • Business professionals	2. CUSTOMER CONSTRAINTS • Difficulty starting conversations • Lack of personalized suggestions • Uncertainty about relevant topics • Need for reliable factual context • Limited confidence in networking	3. AVAILABLE SOLUTIONS • Generic icebreaker lists • Search engines and social platforms • Manual research before events • General-purpose AI chat tools • Networking and event applications
4. JOBS TO BE DONE / PROBLEMS • Prepare for professional interactions • Start meaningful conversations • Find relevant discussion topics • Verify event-specific information • Save useful outputs for follow-up	5. ROOT CAUSES • Generic advice lacks user context • Event information is fragmented • Users may not know what to ask • Facts may be difficult to verify quickly • No single workflow joins preparation and follow-up	6. USER BEHAVIOUR • Research people and events online • Search for conversation ideas • Copy useful text for later use • Review previous interactions • Rate or save helpful suggestions
7. TRIGGERS • Upcoming conference or meetup • Career fair or professional event • Meeting a new professional contact • Need to prepare an introduction • Need for a relevant follow-up	8. YOUR SOLUTION • Personalized profile and career context • Wikipedia factual verification • Google Gemini content generation • Warm openers, pitches and LinkedIn follow-ups • History, feedback and analytics dashboard	9. CHANNELS / OUTCOME • Responsive web application • Desktop and mobile-friendly interface • Saved conversation history • Ratings and qualitative feedback • Greater confidence and relevance
